*Supported in part by NSF grant #DUE-9972470
Overview

1. Why study faculty conceptions?
2. Overview of larger study.
3. What conceptions do six research university faculty have about the process of solving physics problems (in the context of introductory physics).
Why are Faculty Conceptions Important?

**Faculty Conceptions** → Influence* → **Faculty Teaching Activities** → Influence* → **Student Learning**

1. **Subject** (i.e., knowledge and beliefs about the subject they are teaching)
2. **Teaching and Learning** (e.g., pedagogical knowledge, orientation towards teaching)
3. **Context** (e.g., perceptions of student capabilities, perceptions of administrative constraints)

*Wanted to Improve*

1. Selection of teaching approach
2. Selection of teaching materials
3. Evaluation of teaching

*e.g. Prosser & Trigwell (1999), Understanding Learning and Teaching*
Focus of This Talk

Faculty Conceptions

1. **Subject** (i.e., knowledge and beliefs about the subject they are teaching)
2. **Teaching and Learning** (e.g., pedagogical knowledge, orientation towards teaching)
3. **Context** (e.g., perceptions of student capabilities, perceptions of administrative constraints)

Faculty knowledge and beliefs about the **problem solving process**

- How they model/explain problem solving to students
- How they expect students to solve problems
- How they expect students to learn how to solve problems
- Their attitudes towards curricular materials

Influences
Who Needs to Understand Faculty Conceptions?

Curriculum Developers Need to Understand Faculty Conceptions:
• Instructional materials and/or strategies may not align with faculty conceptions:
  • Non Use by faculty
  • Inappropriate Use by Faculty

Professional Development Providers Need to Understand Faculty Conceptions (for the same reasons that teachers need to understand student conceptions):
• Identify faculty resources (e.g., build on p-prims)
• Identify “gaps” in faculty conceptions (e.g., use bridging analogies)
• Identify conflicting conceptions (e.g., promote disequilibrium)
Goal of this Study

• Begin the process of building a model of faculty conceptions (beliefs and values) about the teaching and learning of problem solving in introductory calculus-based physics based on interviews with physics instructors.

  ▪ Can (how can) faculty conceptions be measured?
  ▪ Can (how can) a model be constructed to describe these conceptions?
    ▪ What are the major features of this model?
    ▪ How are these features related?

The focus of this study is on problem solving because the Physics Education Research Group at UMN is interested in problem solving.
Overview of Study

- Initial model based on 6 UMN faculty.
- Refine and expand the initial model based on interviews with 24 faculty from different institutions.
- Determine the distribution of conceptions among faculty using a larger national sample.
- Sharpen understanding using an international sample.

Lectures

Initial Model of Faculty Conceptions of Teaching and Learning (based on 6 UMN Faculty)
The Problem Solving Process

six research university instructors

Conception 1: A linear decision-making process (backtracking is not necessary) (3 of 6)

Step 1: “Know” physics principle(s) to use
Step 2: Clarify thinking (e.g. by using diagrams)
Step 3: Use tools (e.g., algebra, FBD) to get answer
Step 4: Evaluate answer

Conception 2: A process of exploration and trial and error (2 of 6)

Step 1: Decide on goal (e.g., target to known)
Step 2: “Explore” the problem and “decide” on possibly useful approaches or principles
Step 3: Try most promising approach
Step 4: Evaluate progress (return to step 2 if necessary)

Conception 3: A creative process that is different for each problem (1 of 6)

(process can’t be broken down)
The Problem Solving Process

the Cognitive Psychology perspective*

1. Qualitative Analysis
   - Visualize what is happening
   - Identify Options (e.g., principles or definitions)
   - Draw diagrams
   - Identify goal

2. Quantitative Analysis
   - Sequentially choose sub problems that reduce the gap between goal and known information
   - Implement

3. Answer

4. Evaluate Answer
   - Goal attained?
   - Well specified?
   - Self consistent? (units, signs)
   - Consistent with other information? (e.g., special cases)
   - Optimal? (as clear and simple as possible)

For experts, choices limited by:
1) hierarchical knowledge structure
2) experience

*Based largely on Reif (1995) in AJP & Polya (1957) in How to Solve it
The Problem Solving Process
Conception 1: A linear decision-making (3 instructors)

1. Quantitative Analysis
   - “Know” principle(s) to use

2. Qualitative Analysis
   - Clarify thinking

3. Answer

4. Evaluate Answer

? – How are the correct physics principles selected?
The Problem Solving Process
Conception 2: A process of exploration and trial and error
(2 instructors)

1. Qualitative analysis
   - Explore the problem

2. Quantitative Analysis
   - Come up with possible approaches to try
   - Try most promising approach

3. Answer

Options limited by:
1) Hierarchically organized knowledge structure
2) Ability to recognize similarities with previously solved problems

? – How are the number of possible approaches limited?
The Problem Solving Process
Conception 3: A creative process that is different for each problem (1 instructor)
Conclusions

There are similarities between the Cognitive Psychology view of the PS process and the five instructors who identified a process:

• Main “units” of the problem solving process are similar.
  • Qualitative analysis/clarification phase
  • Decision about approach/principles
  • Implementation
  • Evaluation
• Although the ordering and some details were different.
Conclusions
There are differences between the Cognitive Psychology view of the PS process and the five instructors who identified a process:

• Main difference is the identification of choices in decision making

No choices – predetermined (algorithm) → Linear Decision Making (3 instructors) → Experience is everything

Strategic Decision Making
• Knowledge Structure
• Strategy

Trial & Error (2 instructors) → Monitoring progress is everything

Infinite choices (random)
Implications for Curriculum Developers

No choices – predetermined (algorithm)

- Linear Decision Making (3 instructors)
  - Instruction likely to emphasize error-free and mechanical performance
  - Lots of “Drill & kill” single concept problems

Teaching Activity

Desired Curricular Material

Strategic Decision Making

- Instruction likely to emphasize knowledge organization and PS strategy
  - Framework for organizing and using physics knowledge, PS Strategy

Trial & Error (2 instructors)

- Instruction likely to treat making choices as “magic”
  - Multiple concept problems so students can practice making/evaluating choices

Infinite choices (random)
Implications for Professional Development Providers

1. There are things to build on: basic building blocks of problem solving process are there.

2. There appear to be opposite views within the community.
   - If true, this is a good situation for professional development.
The End
